Face recognition

What is face recognition?

Face verification vs. face recognition

→ Verification

- Input image, name/ID
- Output whether the input image is that of the claimed person

1:1

99.9%

99.9

→ Recognition

- Has a database of K persons
- Get an input image
- Output ID if the image is any of the K persons (or “not recognized”)

1:K

K=100 ←

deeplearning.ai

Face recognition

One-shot learning

One-shot learning

Learning from one example to recognize the person again

Learning a “similarity” function

→ $d(\text{img1}, \text{img2})$ = degree of difference between images

If $d(\text{img1}, \text{img2}) \leq \tau$
 $> \tau$

“same”
“different”

} Verification.

$d(\text{img1}, \text{img2})$

Face recognition

Siamese network

Siamese network

[Taigman et. al., 2014. DeepFace closing the gap to human level performance]

Andrew Ng

Goal of learning

Parameters of NN define an encoding $f(x^{(i)})$

128

Learn parameters so that:

If $x^{(i)}, x^{(j)}$ are the same person, $\|f(x^{(i)}) - f(x^{(j)})\|^2$ is small.

If $x^{(i)}, x^{(j)}$ are different persons, $\|f(x^{(i)}) - f(x^{(j)})\|^2$ is large.

Anchor

A

Positive

$d(A, P) = 0.5$

Want:

$$\underbrace{\|f(A) - f(P)\|^2}_{d(A, P)} + \underline{\alpha} \leq \overset{\nearrow 0.2}{}$$

Anchor

A

Negative

$d(A, N) = \cancel{0.5} \quad (0.7)$

$$\underbrace{\|f(A) - f(N)\|^2}_{d(A, N)}$$

$$\underbrace{\|f(A) - f(P)\|^2}_0 - \underbrace{\|f(A) - f(N)\|^2}_0 + \underline{\alpha} \leq \underline{0} \quad \text{margin}$$

$f(\text{img}) = \vec{0}$

[Schroff et al., 2015, FaceNet: A unified embedding for face recognition and clustering]

Andrew Ng

Loss function

网易云课堂

Given 3 images A, P, N :

$$\underline{L(A, P, N)} = \max \left(\underbrace{\|f(A) - f(P)\|^2 - \|f(A) - f(N)\|^2 + \alpha}_{\geq 0 > 0}, 0 \right)$$

$$J = \sum_{i=1}^m L(A^{(i)}, P^{(i)}, N^{(i)})$$

A, P
 $\uparrow \quad \uparrow$

Training set: 10k pictures of 1k persons

Choosing the triplets A,P,N

During training, if A,P,N are chosen randomly,
 $d(A, P) + \alpha \leq d(A, N)$ is easily satisfied.

$$\|f(A) - f(P)\|^2 + \alpha \leq \|f(A) - f(N)\|^2$$

Choose triplets that're "hard" to train on.

$$\frac{d(A, P) + \alpha}{d(A, P)} \leq \frac{d(A, N)}{d(A, N)}$$

Neural Style Transfer

What are deep
ConvNets learning?

Visualizing what a deep network is learning

Pick a unit in layer 1. Find the nine image patches that maximize the unit's activation.

Repeat for other units.

Neural Style Transfer

Cost function

Neural style transfer cost function

Content C

Style S

Generated image G

$$\mathcal{J}(G) = \alpha \mathcal{J}_{\text{Content}}(C, G) + \beta \mathcal{J}_{\text{Style}}(S, G)$$

[Gatys et al., 2015. A neural algorithm of artistic style. Images on slide generated by Justin Johnson] Andrew Ng

Find the generated image G

1. Initiate G randomly

$G: 100 \times 100 \times 3$
 \uparrow
 RGB

2. Use gradient descent to minimize $J(G)$

$$G := G - \frac{\partial}{\partial G} J(G)$$

deeplearning.ai

Neural Style Transfer

Content cost function

Content cost function

$$\underline{J(G)} = \alpha \underline{J_{content}(C, G)} + \beta J_{style}(S, G)$$

- Say you use hidden layer \underline{l} to compute content cost.
- Use pre-trained ConvNet. (E.g., VGG network)
- Let $\underline{a^{[l](C)}}$ and $\underline{a^{[l](G)}}$ be the activation of layer l on the images
- If $a^{[l](C)}$ and $a^{[l](G)}$ are similar, both images have similar content

$$J_{content}(C, G) = \frac{1}{2} \left\| \underbrace{a^{[l](C)}}_{\text{activation of layer } l \text{ on } C} - \underbrace{a^{[l](G)}}_{\text{activation of layer } l \text{ on } G} \right\|^2$$

Neural Style Transfer

Style cost function

Meaning of the “style” of an image

网易云课堂

Say you are using layer l 's activation to measure “style.”
Define style as correlation between activations across channels.

How correlated are the activations
across different channels?

Intuition about style of an image

Style image

Correlated?
Uncorrelated

Generated Image

Style matrix
